

DISBURSEMENT V2

1st QA

PREPARATION

1. Lists Filtering
 - a. Add date range
 - b. Payee (dropdown with search)
2. Header Information
 - a. Add combo box to the following:
 - i. Department
 - b. Remove the global COST DIVISION dropdown selector from the voucher header block.
 - i. Treasury requires division allocation at the individual line-item level. The header field is redundant and does not sync with or control the line items.

1004 - LISTING FEE	SELECT DIVIS...	SCM-219	07/03/2026	-500

3. Attachments

- a. Situation 1: File uploads successfully but randomly vanishes after a few moments.
 - i. The Culprit: Silently failing background processing or mismatched UI states.
 - ii. What's happening: The frontend successfully sends the file to the server, and the server says "Got it!" (which triggers your success state). However, a second background process, like an auto-save loop, a form validation re-render, or an image compression script, is likely triggering shortly after. When that second process runs, it refreshes the form's data state using outdated info from the database that doesn't include the new file path yet, wiping the UI component clean.
 - b. Situation 2: Opening the file picker, choosing a new file, but clicking "Cancel" wipes out the already uploaded files.
 - i. Destructive state resetting on cancel events.
 - ii. What's happening: When you click "Cancel" on the file upload modal or action, the developer's code likely clears out the *entire* file array state instead of *only* discarding the pending file. It's an "all-or-nothing" reset bug where the cancellation event completely nukes the active memory of existing attachments.
 - c. Situation 3: Success notification pops up for a new upload, but the file never appears in the list.
 - i. The UI List component isn't watching the upload array for changes.
 - ii. What's happening: The network request completes perfectly, which is why the notification service accurately fires off a "Success!" message. However, the file list component on the screen isn't properly hooked up to "react" to the updated data state. Alternatively, the backend might be responding with a success code, but it isn't returning the newly created database ID or URL for that file, leaving the frontend with nothing valid to draw on the screen.
-

4. The System is Double-Counting, The final number (7) is higher than the total number of invoices available for that Purchase Order (4). This means the system's internal checklist is duplicating items behind the scenes every time you click.
 - a. Order of Operations Confusion, Because the math changes depending on *which* invoice you click first, the system is likely tracking your clicks by their visual position on the screen (e.g., "the second item on the list") rather than their actual, unique identities (e.g., Invoice RT-002). If the list shifts or updates in the background, the math breaks.
 - b. "Sticky" or Ghost Data, The system might not be completely wiping the memory clear when you open the window. It could be carrying over hidden selections from other screens or previous clicks, adding them to your current count.

5. **Lack of an "Already Selected" Filter,** When a user clicks "**APPLY MEMO**" or selects a reference, the modal or dropdown list should dynamically filter out records that have already been added to the current grid.
 - a. **Missing Grid-Level Validation:** The form submission or line-addition logic lacks a deduplication check. It should compare new line entries against existing keys in the active allocation table.

6. The Issue is When attempting to process or submit a disbursement voucher, the system throws an unhandled permission error related to a database field, triggers a 502 Bad Gateway API crash, and fails to load crucial system resources (assets and core endpoints).

a. Database Column Permission / Schema Block (The Red Toast Error)

- i. **What's failing:** The frontend form payload includes a field named `released_date` when executing `createDisbursement`.
 - ii. **The Error:** FORBIDDEN - *"You don't have permission to access the field 'released_date' in collection 'disbursement_payments' or it does not exist."*
 - iii. **Impact:** The database layer (Hasura/GraphQL) actively rejects the entry. This happens because the backend role configuration for the active user session hasn't been granted **Select/Insert** access to this specific column, or the column doesn't exist yet on the table in this environment.
- b. Backend API Service Crashes (502 Bad Gateway & 500 Internal Error)
- i. **Impact:** The backend service or API gateway is choking and dropping the connection. This is highly likely because the database exception mentioned above isn't caught gracefully in the backend code, causing the service container to crash when processing the payload.

7. When you click the "+ ADD DEBIT LINE" button to create a new row, the system does not give you a clean, empty line. Instead, it automatically copies all the information from the row right above it, including the Account Name (COA), Cost Division, and Invoice Date.

Where lines meet

8. Overlapped

9. Printables (suggested by treasury)

- Remove from Header, Take out the Cost Division field from the top header block of the printed document.
- Add to Table Rows, Add a new Cost Division column directly into the main itemized payables table. Each row item should clearly display its specific assigned division.
- When a voucher is successfully submitted and opened in the Review Workspace, the system fails to display who created it. The field is completely missing or remaining blank, even though the user is clearly logged into an active account (e.g., *Dev Vertex*) when creating the voucher.

10. A single voucher has one unique Transaction Number (TR#). Inside that specific transaction, a user should never be allowed to select the exact same Purchase Order (PO) or Memo item twice.
- a. Allowed: PO-001 can be applied to Voucher TR-00410, and PO-001 can *also* be applied later to a completely different Voucher TR-00411.

APPROVAL WORKSPACE

1. Add sidebar filtering
 - a. Date range
 - b. Payee
 - c. Date Range
2. Overlapped

PARTICULARS / REMARKS

rtesting.....

3. The uploaded attachments is missing.

RELEASING WORKSPACE

1. Add the MEN2 header printables. Coordinate to sir jake.
2. When you successfully release a check for a voucher, the system correctly updates and clears the payment lines. However, the payables lines (the actual voucher transaction details) remain stuck on the screen as if nothing happened, instead of clearing out or updating to a completed status.
3. When processing a disbursement payment using a Petty Cash account instead of a bank account, the system still triggers a strict validation rule forcing the user to type in a Check Number. If left blank, it completely blocks you from clicking "RELEASE CHECKS".

4. Add Asterisks (*) to Required Labels: Every input field or dropdown that is mandatory for a successful submission must have a clear visual marker. Add a red asterisk (*) directly next to the field name label (for example: TRADE SUPPLIER *, COST DEPARTMENT *). This gives users an immediate heads-up on what they *must* fill out before clicking submit.

5. Highlight Incomplete Fields on Failure: If a user clicks "SUBMIT FOR APPROVAL" but forgot to select a required field or attach required supporting papers, the system should actively show them where the problem is:
 - a. Turn the border of the empty required fields red.
 - b. Keep them highlighted until the user goes back, fixes the field, or uploads the missing papers.
6. What module does the save checks allocation go?

POSTING

1. The BANK CHECKS (CREDITS) table only displays the Check No., Bank & GL, and the Amount. Even though it labels the row as a "*DATED CHECK*" in blue text, it completely hides the actual calendar date that was selected during the releasing step.
2. When a voucher undergoes a partial payment release (e.g., the voucher total is ₱10,000, but Treasury only releases a check for ₱5,000), the Transaction Number (TR#) breaks workflow direction.
 - a. Instead of holding its place in the Releasing Workspace to pay the remaining ₱5,000 balance, the system strips the voucher's "Approved" status and kicks it all the way back to the Approval Workspace with a status of SUBMITTED

LEDGER REGISTER

1. Add Search Bar to the following:
 - a. Division
 - b. Departments
 - c. .
2. when the transaction list is loaded, the bottom navigation elements—specifically the "ROWS PER PAGE" selector on the left and the "PREVIOUS / PAGE 1 OF 65 / NEXT" buttons on the right—are rendering directly on top of the final data rows (like TR-00409). Because these UI elements overlap the text, the rows become completely unclickable.

3. This workspace must function purely as a historical reference ledger. Users must be completely blocked from executing any state changes or workflow actions from this screen.
 - a. Remove/Disable Action Buttons: The Submit, Approve, Release, and Post buttons must be completely removed from this screen (or entirely hidden based on user permission roles).
 - b. Lock Input Fields: Any dropdowns, check allocation inputs, remarks, or amount fields must be changed to a view-only/read-only state so they cannot be clicked, typed in, or edited.

DATA BASE

1. Critical transaction states, user stamps, and timestamps are failing to commit to the database upon workflow progression. The following tables and specific columns are remaining blank or failing to update:
 - a. Disbursement Table
 - i. Transaction_type – Failing to update or classify the transaction type properly.
 - ii. Approver_Id & Date Approved – When a supervisor approves a voucher, the database is failing to stamp *who* approved it and the exact timestamp of the approval.
 - iii. Released_By & Released Date – When a check or petty cash line is released, the database is not recording the person executing the release or the execution date.
 - iv. Posted_By & Posted Date – When the final voucher is posted to the ledger, the system fails to record the poster's identifier and the final posting timestamp.
 - b. Disbursement_Payments Table
 - i. Released_by & Released Date – Even if payment lines or check allocations are saved/cleared visually, the background records are not binding the releasing user's ID or the physical release timestamp to the specific payment row.
